

BUILD ON STELLAR

Hackathon — IBW 2026

Tracks & Handbook

36 hours. Istanbul. Code becomes infrastructure.

Hosted by Rise In & the Stellar Development Foundation.

Hilton Istanbul Bomonti Hotel & Conference Center, Şişli.

How the Tracks Work

This hackathon has one Main Track that every project competes in by default, and two Side Tracks — Agentic and Privacy — that projects can additionally apply to if their work fits the criteria. A single project can win in the Main Track and in one or both Side Tracks.

Side Tracks are opt-in. Tick the relevant box(es) on your submission form, and make sure your demo and write-up clearly address that track's additional requirements.

A total of **\$5,000** in prizes is distributed across the Main Track and Side Tracks.

	Main Track	Hack Agentic	Hack Privacy
Total Prize	\$2,600	\$1,200	\$1,200
First Prize	\$1,200	\$700	\$700
Second Prize	\$800	\$500	\$500
Third Prize	\$600		

In short:

- **Main Track** — automatic for every submission.
- **Hack Agentic** — opt-in, for projects putting autonomous agents on Stellar.
- **Hack Privacy** — opt-in, for projects advancing privacy and selective disclosure.

Track Details

Main Track — Hack On Stellar

AUTOMATIC FOR EVERY TEAM

Track Description

Stellar is fast, low-cost, and programmable - a financial network designed for real-world utility at global scale. This track is the home for every project at the hackathon, regardless of focus area. Whether you're building DeFi primitives, payment rails, consumer apps, developer tools, or onchain experiences, you compete here. The goal is simple: ship something on Stellar that solves a real problem and shows what the network can do.

Your Task

Design, build, and deploy a project on Stellar during the 36-hour hackathon window. Your project can address any domain (DeFi, payments, consumer apps, developer tooling, RWA, identity, gaming, or anything else) as long as Stellar is at the core of it. Use Soroban smart contracts, Stellar Classic, or both. Show us what becomes possible when fast finality and near-zero fees meet a builder with a clear idea.

Examples

- A cross-border remittance app with fiat on/off ramps for an underserved corridor.
- An AMM, lending protocol, or other DeFi primitive built on Soroban.
- A developer SDK, CLI tool, or framework that meaningfully improves the Stellar building experience.
- A consumer app — loyalty, subscriptions, ticketing, social — that hides the crypto and just works.
- A tokenization platform for real-world assets like invoices, real estate, or carbon credits.
- An identity, reputation, or credentials system that fits the Stellar account model.

Requirements

Submit your project narrative, MVP, technical documentation, and smart contract code. Deploy to Stellar testnet (mainnet is a plus). All standard hackathon deliverables apply - see General Requirements below.

Side Track: Hack Agentic

OPT-IN - AUTONOMOUS AGENTS ON STELLAR

Track Description

Autonomous agents are moving from chat interfaces into the real economy. They book, buy, negotiate, and coordinate, and they increasingly need money rails that can keep up. Stellar's fast finality, low fees, and built-in asset model make it a natural settlement layer for machines transacting at machine speed.

This track is for projects that put agents on Stellar as first-class economic actors. Not chatbots that read the blockchain, agents that do things on it. The future of payments isn't just human-to-human; it's human-to-agent, agent-to-agent, and agent-to-service. We want to see that future built here.

Your Task

Build a project where one or more autonomous agents interact meaningfully with Stellar - sending value, executing contracts, coordinating with other agents, or providing infrastructure that makes agentic commerce on Stellar possible. The agent's onchain action must be genuinely delegated, not a wrapper around manual human approval for every transaction. Bonus points for clear safety design (spending limits, recoverability, approval flows) and for use cases that only make sense because the chain is Stellar.

Examples

- An agent that autonomously rebalances a user's portfolio or manages liquidity on Stellar DEX.
- An agent-to-agent commerce demo: agents negotiating, paying, and coordinating economic activity onchain.
- An agent wallet or SDK purpose-built for AI agents on Stellar — with spending limits, session keys, or scoped permissions.
- A consumer app where an AI assistant pays for services (APIs, subscriptions, microtransactions) on the user's behalf via Stellar.
- Infrastructure or middleware that makes Stellar a first-class destination for agents (intent layers, agent identity, reputation, etc.).

Requirements

In addition to the standard hackathon deliverables, your submission must clearly identify: (1) which actions the agent performs autonomously, (2) what safeguards are in place, and (3) why Stellar is the right chain for this use case.

Side Track: Hack Privacy

OPT-IN - PRIVACY AND SELECTIVE DISCLOSURE

Track Description

Public blockchains are public by default. Every balance, every transfer, every counterparty — visible to anyone. For most real-world financial use cases, that's a problem: payroll, B2B settlement, personal payments, and sensitive credentials all need privacy by design. The technology to fix this exists — zero-knowledge proofs, confidential transactions, selective disclosure — and Stellar is ready for builders to bring it onchain.

This track is for projects that meaningfully advance privacy, confidentiality, or selective disclosure for users on Stellar - without sacrificing the compliance and auditability that real-world finance demands.

Your Task

Build a project that gives users real control over what information they reveal on Stellar — and to whom. This can mean hiding amounts or counterparties, proving facts without exposing the underlying data, building privacy-preserving identity systems, or enabling confidential off-chain computation that settles onchain. Be explicit about your threat model: what's hidden, from whom, and under what assumptions.

Examples

- A confidential payments app where amounts and/or recipients are hidden but transactions remain verifiable.
- A zero-knowledge identity or credentials system on Stellar — prove you're eligible without revealing who you are.

- A privacy-preserving payroll or B2B settlement tool that hides commercial details from competitors but stays auditable.
- A private voting, allowlist, or sybil-resistance mechanism using ZK proofs.
- Compliance-aware privacy infrastructure: privacy with optional disclosure for regulators, auditors, or counterparties.

Requirements

In addition to the standard hackathon deliverables, your submission must clearly state: (1) what information is hidden and from whom, (2) which privacy technology or technique you use to accomplish it (e.g. ZK proofs, confidential transactions, MPC, FHE, TEEs, selective disclosure), and (3) the threat model your design protects against. Nice to have: a clear statement of the cryptographic assumptions your design relies on.

Workshop Details

Vibe Coding Workshop: Kaan Kacar

This workshop is a hands-on introduction to using free AI tools in real developer workflows.

We will explore how to integrate free AI models into tools like VS Code and Claude Code, and how to use them effectively for coding, debugging, and building projects.

Participants will also learn how to set up a fully working development environment using free AI models instead of paid APIs, and how these tools can be combined into a practical automation workflow.

At the end, we will walk through a real open-source project called *stellar-build*, showing how AI can be directly used inside a production-style codebase.

<https://github.com/kaankacar/stellar-build>

ZK Workshop: Atahan Yildirim

A workshop exploring the core primitives of privacy and agentic systems, and how they can be applied within the Stellar ecosystem. Participants will learn how to design and build efficient, composable projects by combining privacy-preserving techniques with agent-driven infrastructure.

We will start with the primitives of privacy, why do we need it, how does it relate to agents and how we can apply it to our apps

At the end of the workshop, we will go through [this example project](#) and try it live:

Other Details

General Requirements

Project submissions must include the following:

The Narrative “Why”

- A brief explanation of what you are building, what it fixes, who it's helping, why it's important, and what your value proposition is.

Your MVP (Minimum Viable Product)

- This is the primary deliverable: your code. Provide a URL to your public GitHub repository with a well-defined README, your documented contracts, links to deployed artifacts, your front-end, and your working demo.
- Be sure to use the Soroban SDK and deploy your contracts to the Stellar testnet.

Technical Docs

- Technical design docs explaining how your project fits together, what the main components are, why you made various design decisions, what tradeoffs you made, and what challenges you overcame.

Track Selection

- The Main Track is automatic. Tick the relevant box(es) on your submission form if you are also applying to the Agentic and/or Privacy Side Tracks. Side Tracks require their additional requirements (above) to be addressed in your submission.

Judging Criteria

Judges will evaluate your project for potential impact, thoughtful design, technical implementation, user experience, and ecosystem fit. Here's what they will look at:

Meaningful Idea & Real-World Impact

- Impactful and well thought out?
- Problem statement clearly defined?
- How many people does it impact? How does it provide a meaningful benefit?
- Market viability.

Technical Implementation

- **Functionality:** app deployed on testnet, features work as described, front-end stable and functional. Using Passkeys is a nice-to-have.

- **Implementation:** storage types used correctly, auth used appropriately, state stored in a reasonable way.
- **Technical Design Docs:** does the technical design make sense? Is it well adapted for the problem? Is it clearly explained in the tech docs?

User Experience

- Easy and intuitive interface?
- Functionality implemented in a clear way?
- Well-organized, complete, and easy to understand?

Ecosystem Fit

- Effectively uses Stellar Dev Tools, SDKs, CLI.
- Demonstrates clear understanding of the Stellar ecosystem.
- Demonstrates how and why Stellar provides specific advantages for your project.
- Demonstrates value to the Stellar ecosystem.

Presentation and Documentation

- Is the project clearly explained in the demo or README?
- Are the components and flow easy to understand for a reviewer?
- Do the presentation and docs clearly communicate intent, architecture, and how to test it?

Side Track judging.

Projects applying to the Agentic or Privacy Side Tracks will additionally be evaluated against the requirements listed in each track's section. A strong Main Track project is the foundation — Side Track placement goes to projects that also meaningfully advance the frontier of their chosen Side Track.

How To Submit Your Project

Judging Portal

All teams must submit their project through the judging portal before the submission deadline. Incomplete or missing submissions will not be evaluated.

Submission Portal: <https://www.risein.com/programs/build-on-stellar-hackathon>

Your submission must include:

- Team name and all team members' full names and contact information

- All relevant project links (GitHub repository, live demo, deployment URL)
- Presentation/pitch deck link
- Selection of the hackathon track(s) you are applying to

Important: You will only be evaluated for the tracks you select during submission. Projects will not be considered for tracks that were not chosen at the time of submission.

Judging Process

Judges will be grouped according to hackathon tracks (Main Track, Hack Agentic, Hack Privacy). After the submission deadline, each team will receive a presentation slot assignment based on their selected tracks.

Each team will have a maximum of 5 minutes to present their project live to the judges assigned to their tracks. Make sure your demo and key points are ready to deliver clearly within this time.

Presentation Template

We have prepared an official presentation template for all teams. **Please make a copy of the template and use it as the base for your pitch;** do not present directly from the shared template file.

You are welcome to add additional slides as needed, but the provided structure should serve as your foundation. Using the template ensures judges can follow a consistent format and helps you cover all the key points they will be looking for.

 Presentation Template:

Hacker Resources

Resource Hub's

- **Stellar Ecosystem Resources:** <https://github.com/stellar/ecosystem-resources>
- **Stellar AI Skills:** <https://skills.stellar.org/>

Smart Wallets

- Demo chat application — built specifically to help inspire you for this hackathon. Available in [Svelte/Astro](#), [React](#), and [Vanilla](#) flavors.
- **Passkey-Kit:** github.com/kalepail/passkey-kit — a TypeScript SDK for creating and managing Stellar smart wallets.
- **Smart Wallet Docs:** developers.stellar.org/docs/build/apps/smart-wallets — knowledgebase, examples, and resources for using passkeys for wallet authentication.
- **Smart Contract Authorization:** developers.stellar.org/docs/learn/encyclopedia/security/authorization — the contract authorization framework for Stellar smart contracts.

Smart Contract Development

- **Getting Started:** developers.stellar.org/docs/smart-contracts/getting-started/setup — the gateway to the Stellar smart contract developer experience.
- **Example Contracts:** developers.stellar.org/docs/build/smart-contracts/example-contracts — sample code for DeFi features like liquidity pools, token swaps, etc.

Dapp Development

- Frontend Templates — fork and hit the ground running.
- [Scaffold Stellar Astro Template](#)
- [SvelteKit with Passkey Kit Template](#)
- **Guestbook Tutorial:** developers.stellar.org/docs/build/apps/guestbook/overview — a dapp tutorial with passkey-powered smart wallets.
- **Build Applications Tutorials:** developers.stellar.org/docs/building-apps/overview — JavaScript implementations of common wallet functionality.
- **Stellar Design System:** design-system.stellar.org — components and styles for easier React development.

Explore the Network

- **Stellar Lab:** lab.stellar.org — interact with the network and query activity.
- **Stellar.Expert:** stellar.expert — block explorer for ledger entries, accounts, assets, analytics.

Connect to the Network

- **OpenZeppelin Relayer:** docs.openzeppelin.com/relayer
- **Stellar RPC:** developers.stellar.org/docs/data/apis/rpc — real-time access to Stellar network data.

Build on the Network

- **Developer Tools:** developers.stellar.org/docs/tools/developer-tools — organized list of available tools and services.
- **Get Testnet Funds**
<https://lab.stellar.org/account/fund?network=testnet&label=Testnet&horizonUrl=https://horizon-testnet.stellar.org&rpcUrl=https://soroban-testnet.stellar.org&passphrase=Test%20SDF%20Network%20/%20September%202015::>
- **SDK Library:** developers.stellar.org/docs/tools/sdks/library — Stellar SDKs in almost every language.
- **Stellar Ecosystem Resources:** github.com/stellar/ecosystem-resources — resources for in-person events and hackathons.
- **Frontend Bindings:**
developers.stellar.org/docs/build/smart-contracts/getting-started/hello-world-frontend — generate a typed NPM package for frontend integration.

Stablecoin Resources

- **Circle USDC and EURC Testnet Faucet:** faucet.circle.com — testnet tokens for two widely circulated stablecoins.
- **OpenZeppelin Open Source Relayer & Monitor Docs:** docs.openzeppelin.com/open-source-tools
- **a16z — How Stablecoins Will Eat Payments:** a16zcrypto.com
